

Enterprise-Grade Security for Snowflake

Enable governed data sharing, faster access, and secure AI and application development in the most complex enterprise environments while protecting sensitive data through seamless, policy-based access.

As Snowflake powers more collaboration, analytics, and AI, data and security teams must deliver secure, compliant access at scale across multiple Snowflake instances, diverse geographies with unique business and regulatory requirements, and a mix of internal users, external partners, and data-driven applications.

TrustLogix Cloud Data Security Platform provides complete visibility and control over Snowflake data access, streamlines policy

enforcement, and protects sensitive information across sharing, AI, and analytics workflows, even in the most complex environments. It also extends protection to upstream and downstream data not covered by Snowflake's native controls.

Cloud-native and deployable in minutes, TrustLogix offers proxyless, agentless protection with no infrastructure changes and flexible deployment options without ever accessing your data.

Benefits

Streamline Access Governance:

Deliver fast, secure data access by gaining full visibility into users and roles, and enforcing policies that protect sensitive data and enable safe collaboration.

Securely Deploy AI:

Protect sensitive training data and govern AI agent access to support responsible, compliant AI development and deployment in Snowflake.

Mitigate Data Access Risks:

Continuously monitor Snowflake to detect access risks, misconfigurations, and unusual activity. Enable fast remediation and proactive compliance at scale.

Capabilities That Power Enterprise-Grade Security in Snowflake

Data Access and Governance

- **Gain complete visibility** into users, roles, and access paths across all Snowflake accounts.
- **Create flexible, enterprise-grade RBAC, ABAC policies** using a no-code builder and prebuilt templates, Snowflake tag integration, and AI-driven recommendations.
- **Build dynamic relationship-based controls** that map permissions to business roles and geographic rules, automatically adapting access policies as organizational structures and regulations evolve.
- **Empower data and domain owners** through federated policy management for consistent policy deployment across environments and at scale.

AI and Agent Security for Snowflake Cortex

- **Govern access to data used in AI** and apply purpose-based policies to secure AI and ML workflows.
- **Protect Cortex Document AI content** with fine-grained access controls and enforce oversight for Cortex Agents.

Risk Detection and Posture Management

- **Detect dark data, excessive privileges, and misconfigurations** with enhanced DSPM capabilities integrated with Snowflake Horizon Catalog and Trust Center.
- **Automate Snowflake network policy creation** with AI-driven insights that analyze access patterns, detect anomalies, and recommend IP-based controls.
- **Manage data sharing** with privacy-aware policies, sensitive data redaction, and flow visualization.
- **Correlate access and data movement** across environments to identify policy gaps using Snowflake views like access history and query history.

Continuous Compliance and Audit Readiness

- **Enforce policies** aligned with frameworks like HIPAA, PCI-DSS, DORA and GDPR, and automate reporting for ongoing audit readiness.
- **Respond to violations** in real time and maintain governance throughout the full data lifecycle, including AI and third-party access.
